

FOR IMMEDIATE RELEASE: April 19, 2011

Centerfield Technology, in conjunction with Databeam, is releasing two innovative database tools for the iSeries community.

The first, dataCapture, allows administrators to easily and efficiently audit changes to files and run graphical reports. Within minutes of downloading the software, it can be configured and transactions analyzed. The flexible reporting built into dataCapture allows iSeries users to answer questions like:

- Which user changed order number “39920A” since it was entered into the system?
- Was the file F0911 changed by someone using Interactive SQL? If so when did it happen and who made the change?
- How many new orders came in during the last 2 days?
- Which program has been deleting product descriptions?

The second product, dataAlert, builds on the capabilities of dataCapture to proactively inform business users of important events. Created to be simple to install and use, dataAlert enables IT to provide real-time data to internal or external customers. With dataAlert, IT can show immediate and highly visible value to business processes that need information in real time. Alerts are simple to set up and can be personalized so you get the information you want and nothing more. Applications for dataAlert:

- Email the sales manager every time a sales opportunity takes a step forward.
- Send an email to the support manager every time a key customer opens a support ticket in the CRM system.
- Inform the purchasing department when the inventory for a particular part drops below a pre-defined threshold.

Centerfield is offering dataCapture free of charge. For companies that desire it, Centerfield will offer phone and email support for a modest annual fee. There is a fee for dataAlert.

“We are excited to continue Centerfield’s tradition of helping iSeries customers get the most out of their applications and DB2. Both dataCapture and dataAlert will enable IT to leverage existing applications in some very innovative ways to deliver value to their customers.” Aaron Hasley, Senior Developer at Centerfield.
